MLX90817 Absolute Pressure Sensor IC

1. Features and Benefits

- High accuracy absolute pressure sensor
- Ratiometric Analog Output
- System in a package: MEMS, analog front end circuitry, 16 bit microcontroller, analog back end circuitry, voltage regulators
- Large automotive temperature range (-40°C to 150°C)
- Automotive qualified and automotive diagnostic features (clamping levels, broken track diagnostics, multiple internal fault diagnostics)
- Factory calibrated or fully programmable or reconfigurable through the connector for customized calibration curves
- Assembled in a rugged easy to use 4x5mm DFN package

2. Application Examples

- Automotive applications with absolute pressure from 1bar to 5.5bar
- Manifold and Turbo Manifold Air Pressure
- Manifold and Turbo Manifold Air Pressure combined with Temperature
- LPG/CNG Injectors

4. Functional Diagram

Figure 1: Functional block diagram

5. General Description

The MLX90817 is a packaged, factory calibrated, absolute pressure sensor delivering ratiometric analog output.

Use of an optimized architecture and a high density CMOS technology imparts the MLX90817 with best in class automotive EMC performance. A DSP based architecture using a 16bit microcontroller provides outstanding performance in terms of initial accuracy.

A smart package and die assembly concept suits applications with stringent automotive temperature and stress conditions needing small drift over life.

10. Detailed General Description

The MLX90817 contains a pressure sensing element which consists of a diaphragm realized in the silicon chip by wafer bonding on an etched cavity with built in reference vacuum. The diaphragm reacts to a change in absolute pressure. The internal strain increases, in particular at the border of the diaphragm. Here, the piezo-resistive elements have been implanted into the silicon diaphragm forming a Wheatstone bridge, which act as a transducer.

The electronics front end amplifies the signal from the bridge, performs a coarse offset compensation and an ADC conversion. The DSP performs the compensations over temperature. Furthermore, the digital circuit provides some filtering, the possibility to linearize the pressure signal and also implements the clamping function. This chip delivers an analog output proportional to the pressure. A broken wire detection block allows actively driving the analog output to one of the rails in case of a broken supply or ground connection. Extensive protection of the supply lines allows the MLX90817 to handle extreme overvoltage conditions and is immune to severe external disturbances. Several diagnostic functions (over-voltage, under-voltage, overpressure, under pressure detections) have been implemented on the 90817 and can be enabled by programming EEPROM settings. Figure 4 describes MLX90817 block diagram.

Figure 4: MLX90817 block diagram

11. Default programmed settings

The MLX90817 is calibrated at the final manufacturing test step. During the calibration, settings are stored in the on chip EEPROM to define the pressure transfer curve as well as the output clamping levels. Together with the transfer functions, the IC filter values are set.

The transfer curves as described below are valid assuming a supply voltage of 5V for the IC, the analog output scales in a ratiometric way to the supply voltage.

Table 13: DCH-008 Default configuration

12. Filters

There are two filters available to filter the pressure signal. The first filter is a Small Signal Filter which can be disabled or enabled. The second filter is a first order low pass filter for the pressure signal which has a programmable depth.

12.1. PFLT

PFLT is a programmable first order low pass filter. The depth of this filter can be selected. This filter can be configured to select the optimal trade-off between response time and output noise.

The low pass filter is implemented according to the following formula:

$$Filter_{output}(k) = \frac{Filter_{input}(k) - Filter_{output}(k-1)}{2^{PFLT}} + Filter_{output}(k-1)$$

The PFLT parameter in the formula is set in EEPROM and can have a value between 0 and 9. An overview of typical response times when applying a step on the input using different PFLT filter settings can be found in Table 14. Filter setting 0 disables the PFLT.

| PFLT setting | Response time in ms ⁽²⁾ |
|--------------|---------------------------------------|
| 0 | 0.93 |
| 1 | 1.25 |
| 2 | 2 |
| 3 | 3.7 |
| 4 | 7.1 |
| 5 | 13.7 |
| 6 | 27.0 |
| 7 | 53.8 |
| 8 | 106.8 |
| 9 | 203.8 |

Table 14: Filter settings and typical response times

12.2. SSF

The SSF (Small Signal Filter) is a digital filter which is designed not to have an impact on the response time of a fast changing pressure signal like a pressure step. When a large signal change at the input is present, the filter is bypassed and not filtering the signal. For small signal changes, which are in most cases noise, the filter is used and filtering the pressure signal.

The Small Signal Filter can be enabled or disabled in EEPROM.

² Time needed for the output to change from an input pressure step to 90% of its final value.

Absolute Pressure Sensor IC

13. Analog Front End

The analog front end of the MLX90817 consists of a chopping stage and 3 amplification stages as can be seen in Figure 7. There are also several input diagnostics integrated into this front end to be able to detect a broken InP or InN connection or an input which is out of range. This diagnostic information is transferred to the microcontroller to handle further action for example flagging a diagnostic message.

Figure 7: Analog front end block diagram

The first stage is an instrumentation amplifier of which the gain can be programmed using 3 bits to cover a gain range between 4.5 and 10.6.

Transfer equation:

OUTP1 – OUTN1 = Gst1*(InP – InN) in phase 1

OUTP1 – OUTN1 = Gst1*(InN – InP) in phase 2

The second stage is a fully differential amplifier. The gain of the amplifier can be calibrated using 1 bit. Transfer equation:

OUTP2 - OUTN2 = -Gst2*(OUTP1 - OUTN1) - Gst2*(CSOF1 - CSOF2) in phase 1 OUTP2 - OUTN2 = -Gst2*(OUTN1 - OUTP1) - Gst2*(CSOF2 - CSOF1) in phase 2

The CSOF1 and CSOF2 signals are generated by the coarse offset DAC with the following transfer functions:

$$CSOF1 = \frac{VDDA}{2} + (-1)^{CO7} * \left(\frac{2}{3} - \frac{1}{3}\right) * \frac{VDDA}{2} * \frac{CO[6:0]}{127}$$
$$CSOF2 = \frac{VDDA}{2} - (-1)^{CO7} * \left(\frac{2}{3} - \frac{1}{3}\right) * \frac{VDDA}{2} * \frac{CO[6:0]}{127}$$

CO[6:0] fixes the DAC output. CO7 is used for the polarity.

The third stage is an integrator which is controlled using 2 bits to set a gain between 1.6 and 6.4 Transfer equation at the outputs of the amplifier:

 $OUTP3 - OUTN3 = -N^{*}(C1/C2)^{*}(OUTP2 - OUTN2)$

OUTP3_common_mode and OUTN3_common_mode = VCM = VDDA/2

In this equation N represents the number of integration cycles which is a fixed value of N = 40.

C2 is a fixed feedback capacitor of approximately 5pF. C1 can have 3 different values: 0.2pF, 0.4pF or 0.8pF.

Transfer equation after the ADC: Pressure_ADC = ((OUTN3 - OUTP3)*2¹⁶/VDDA) + 32768

Absolute Pressure Sensor IC

An overview of all possible values for Gst1, Gst2 and Gst3 can be found in Table 15 below.

The input stage is designed to work with an input common-mode voltage range between 42%Vbrg and 58%Vbrg.

| Gain setting | Gst1 | Gst2 | Gst3 | Total gain | FS Differential input signal |
|-----------------|-------|-------|-------|---------------|---------------------------------|
| [-] | [V/V] | [V/V] | [V/V] | [V/V] | [mV] |
| 0 | 4.49 | -1.25 | 1.6 | -9.0 | ± 195 |
| 1 | 5.06 | -1.25 | 1.6 | -10.1 | ± 173 |
| 2 | 5.8 | -1.25 | 1.6 | -11.6 | ± 151 |
| 3 | 6.52 | -1.25 | 1.6 | -13.0 | ± 134 |
| 4 | 7.43 | -1.25 | 1.6 | -14.9 | ± 118 |
| 5 | 8.37 | -1.25 | 1.6 | -16.7 | ± 105 |
| 6 | 9.35 | -1.25 | 1.6 | -18.7 | ± 94 |
| 7 | 10.6 | -1.25 | 1.6 | -21.2 | ± 83 |
| 8 | 4.49 | -3.5 | 1.6 | -25.1 | ± 70 |
| 9 | 5.06 | -3.5 | 1.6 | -28.3 | ± 62 |
| 10 | 5.8 | -3.5 | 1.6 | -32.5 | ± 54 |
| 11 | 6.52 | -3.5 | 1.6 | -36.5 | ± 48 |
| 12 | 7.43 | -3.5 | 1.6 | -41.6 | ± 42 |
| 13 | 8.37 | -3.5 | 1.6 | -46.9 | ± 37 |
| 14 | 9.35 | -3.5 | 1.6 | -52.4 | ± 33 |
| 15 | 10.6 | -3.5 | 1.6 | -59.4 | ± 29 |
| 16 | 4.49 | -3.5 | 3.2 | -50.3 | ± 35 |
| 17 | 5.06 | -3.5 | 3.2 | -56.7 | ± 31 |
| 18 | 5.8 | -3.5 | 3.2 | -65.0 | ± 27 |
| 19 | 6.52 | -3.5 | 3.2 | -73.0 | ± 24 |
| 20 | 7.43 | -3.5 | 3.2 | -83.2 | ± 21 |
| 21 | 8.37 | -3.5 | 3.2 | -93.7 | ± 19 |
| 22 | 9.35 | -3.5 | 3.2 | -104.7 | ± 17 |
| 23 | 10.6 | -3.5 | 3.2 | -118.7 | ± 15 |
| 24 | 4.49 | -3.5 | 6.4 | -100.6 | ± 17 |
| 25 | 5.06 | -3.5 | 6.4 | -113.3 | ± 15 |
| 26 | 5.8 | -3.5 | 6.4 | -129.9 | ± 13 |
| 27 | 6.52 | -3.5 | 6.4 | -146.0 | ± 12 |
| 28 | 7.43 | -3.5 | 6.4 | -166.4 | ± 11 |
| 29 | 8.37 | -3.5 | 6.4 | -187.5 | ± 9 |
| 30 | 9.35 | -3.5 | 6.4 | -209.4 | ± 8 |
| 31 | 10.6 | -3.5 | 6.4 | -237.4 | ± 7 |

Table 15: Gain and input signal range of the analog front end

14. ADC

The 16 bit differential ADC has a range from –VDDA/2 to +VDDA/2.

There are 7 different ADC channels. Channel 0 is not used. Table 16 below describes all the channels.

| ADC | Signal | Remarks |
|----------|---------|--|
| SIN[2:0] | | |
| 0 | - | Nothing connected |
| 1 | Р | Pressure |
| 2 | Tint | Internal Temperature |
| 3 | Vsup | External Supply |
| 4 | InP/InN | Multiplexing between Positive/Negative Sensor Output |
| 5 | Vdig | Digital Regulator |
| 6 | Tntc | NTC Output |
| 7 | Text | External Temperature |

Table 16: ADC channels

The different channels are converted in a constantly repeating sequence. A new ADC conversion is done every 50us following the sequence shown below in Figure 8. This is resulting in an updated pressure output value every 200us.

Figure 8: ADC sequence

15. Digital

The digital is built around a 16-bit microcontroller. It contains besides the processor also ROM, RAM and EEPROM and a set of user and system IO registers.

Temperature compensation of the pressure signal and pressure linearization is handled by the microcontroller. For the pressure compensation there are EEPROM parameters allocated to be able to cover a large variety of calibration approaches.

Both for gain and offset of the pressure signal, there is a separate temperature dependency programmable ranging from a temperature independence to a first order, second order and finally a third order compensation. This is reflected in EEPROM parameters for the offset (O0, O1, O2 and O3) and for the gain (G0, G1, G2 and G3). If required, the linearity of the pressure signal can also be compensated without a temperature dependency or

with a first order temperature dependency through EEPROM parameters L0 and L1.

Absolute Pressure Sensor IC

16. Wrong Connections Overview

Table 17 provides an overview of the behavior of the MLX90817 when different combinations of connections to GND, VDD and OUT are made.

| GND | VDD | Analog out | Effect on output | Action after wrong connection |
|--------------|--------------|----------------------|---|----------------------------------|
| 0V | 5V | Pull-down or Pull-up | Normal operation | Normal operation |
| Disconnected | 5V | Pull-down or Pull-up | High Fault Band | Normal operation |
| 0V | Disconnected | Pull-down or Pull-up | Low Fault Band | Normal operation |
| 0V | 5V | Disconnected | Low Fault Band for Pull-down High Fault Band for Pull-up | Normal operation |
| 0V | 5V | 0V | Low Fault Band | Normal operation |
| 0V | 5V | 5V | High Fault Band | Normal operation |
| 0V | 5V | 18V | 18V | Normal operation |
| 0V | 0V | Pull-down or Pull-up | Low Fault Band | Normal operation |
| OV | 18V | Pull-down or Pull-up | Low Fault Band for Pull-down High Fault Band for Pull-up | Normal operation |
| 5V | 5V | Pull-down or Pull-up | High Fault Band | Normal operation |
| 5V | 0V | Pull-down or Pull-up | | Normal operation |

Table 17: Wrong connections overview

17. Diagnostics

17.1. Input Diagnostics

An overview of the different input diagnostics conditions and their corresponding fault band and diagnostic source can be found in Table 18.

| Condition | Fault Band | Diagnostic Source |
|---------------------------|------------|-------------------|
| Vbrg disconnected | Low | ERR_EN_SPSN |
| GND (sensor) disconnected | Low | ERR_EN_SPSN |
| InP disconnected | Low | ERR_EN_BW |
| InN disconnected | Low | ERR_EN_BW |
| Vbrg shorted to GND | Low | ERR_EN_SPSN |
| InP shorted to GND | Low | ERR_EN_SPSN |
| InN shorted to GND | Low | ERR_EN_SPSN |
| InP shorted to Vbrg | Low | ERR_EN_SPSN |
| InN shorted to Vbrg | Low | ERR_EN_SPSN |

Table 18: Input diagnostics

Absolute Pressure Sensor IC

17.2. Diagnostic Sources

The MLX90817 product has several internal checks which monitor the status of device. These checks or diagnostic sources can be enabled or disabled based on the sensor module requirements. An overview of the different diagnostic sources, their enable/disable parameter and the explanation of their functionality can be found below in Table 19. The default diagnostic configuration for the different option codes can be found in Table 20.

| Parameter | Error condition |
|--------------|---|
| ERR_EN_TINT | The Internal temperature could not be measured/calculated |
| ERR_EN_IO | RAM configuration error |
| ERR_EN_SPSN | SP or SN pin voltage out of range |
| ERR_EN_PV | The pressure value could not be measured/calculated |
| ERR_EN_PP | Pressure parameter error |
| ERR_EN_BW | A broken wire is detected in the pressure sensor path |
| ERR_EN_VSUPH | The supply voltage is too high |
| ERR_EN_VSUPL | The supply voltage is too low |
| ERR_EN_TCHIP | The chip temperature out of range |

Table 19: Diagnostic sources

| Parameter | Dxx- 001 | Dxx- 003 | Dxx- 008 | Dxx- 010 | Dxx- 012 | Dxx- 013 | Dxx- 014 | Dxx- 000 |
|--------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|-------------|
| ERR_EN_TINT | × | × | × | × | × | × | × | × |
| ERR_EN_IO | ~ | ✓ | ~ | ✓ | ~ | ~ | × | ✓ |
| ERR_EN_SPSN | ~ | ✓ | ~ | ✓ | ~ | ~ | × | ✓ |
| ERR_EN_PV | ~ | ✓ | ~ | ✓ | ~ | ~ | × | ✓ |
| ERR_EN_PP | ~ | ✓ | ~ | ✓ | ~ | ~ | × | ✓ |
| ERR_EN_BW | ~ | ✓ | ~ | ✓ | ~ | ~ | × | ✓ |
| ERR_EN_VSUPH | × | × | × | × | × | × | × | × |
| ERR_EN_VSUPL | × | × | × | × | × | × | × | × |
| ERR_EN_TCHIP | ~ | ~ | ~ | ~ | ~ | ~ | × | ✓ |

Table 20: Default diagnostic configuration

The level of the over and under voltage diagnostics can be configured according to the ranges described in Table 21.

| Parameter | Min | Max | Units | Comment |
|---|------|------|-------|--|
| Under voltage detection threshold range | 3.25 | 5.74 | V | Optional and Programmable with 8 bits in parameter VSUP_LOW |
| Overvoltage detection threshold range | 4.25 | 6.74 | V | Optional and Programmable with 8 bits in parameter VSUP_HIGH |
| Over-/Under-voltage detection accuracy | | 200 | mV | |

20. Standard information regarding manufacturability of Melexis products with different soldering processes

Our products are classified and qualified regarding soldering technology, solderability and moisture sensitivity level according to following test methods:

Reflow Soldering SMD's (Surface Mount Devices)

- IPC/JEDEC J-STD-020 Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices (classification reflow profiles according to table 5-2)
- EIA/JEDEC JESD22-A113
 Preconditioning of Nonhermetic Surface Mount Devices Prior to Reliability Testing (reflow profiles according to table 2)

Wave Soldering SMD's (Surface Mount Devices) and THD's (Through Hole Devices)

- EN60749-20 Resistance of plastic- encapsulated SMD's to combined effect of moisture and soldering heat
- EIA/JEDEC JESD22-B106 and EN60749-15
 Resistance to soldering temperature for through-hole mounted devices

Iron Soldering THD's (Through Hole Devices)

 EN60749-15 Resistance to soldering temperature for through-hole mounted devices

Solderability SMD's (Surface Mount Devices) and THD's (Through Hole Devices)

 EIA/JEDEC JESD22-B102 and EN60749-21 Solderability

For all soldering technologies deviating from above mentioned standard conditions (regarding peak temperature, temperature gradient, temperature profile etc) additional classification and qualification tests have to be agreed upon with Melexis.

The application of Wave Soldering for SMD's is allowed only after consulting Melexis regarding assurance of adhesive strength between device and board.

Melexis is contributing to global environmental conservation by promoting **lead free** solutions. For more information on qualifications of **RoHS** compliant products (RoHS = European directive on the Restriction Of the use of certain Hazardous Substances) please visit the quality page on our website: http://www.melexis.com/quality.aspx

21. ESD Precautions

Electronic semiconductor products are sensitive to Electro Static Discharge (ESD). Always observe Electro Static Discharge control procedures whenever handling semiconductor products.

This documentation is in fact provided without warranty, term, or condition of any kind, either implied or expressed, including but not limited to warranties of merchantability, satisfactory quality, non-infringement, and fitness for purpose. Melexis, its employees and agents and its affiliates' and their employees and agents will not be responsible for any loss, however arising, from the use of, or reliance on this document. Notwithstanding the foregoing, contractual obligations expressly undertaken in writing by Melexis prevail over this disclaimer.

This document is subject to change without notice, and should not be construed as a commitment by Melexis. Therefore, before placing orders or prior to designing the product into a system, users or any third party should obtain the latest version of the relevant information.

Users or any third party must determine the suitability of the product described in this document for its application, including the level of reliability required and determine whether it is fit for a particular purpose.

This document as well as the product here described may be subject to export control regulations. Be aware that export might require a prior authorization from competent authorities. The product is not designed, authorized or warranted to be suitable in applications requiring extended temperature range and/or unusual environmental requirements. High reliability applications, such as medical life-support or life-sustaining equipment or avionics application are specifically excluded by Melexis. The product may not be used for the following applications subject to export control regulations: the development, production, processing, operation, maintenance, storage, recognition or proliferation of: 1. chemical, biological or nuclear weapons, or for the development, production, maintenance or storage of missiles for such weapons;

2. civil firearms, including spare parts or ammunition for such arms;

3. defense related products, or other material for military use or for law enforcement;

4. any applications that, alone or in combination with other goods, substances or organisms could cause serious harm to persons or goods and that can be used as a means of violence in an armed conflict or any similar violent situation.

No license nor any other right or interest is granted to any of Melexis' or third party's intellectual property rights.
