INSPIRED ENGINEERING

## Features and Benefits

- Low voltage supply : from 2.5 V to 5.5 V
- Chopper-stabilized amplifier stage
- Low power switch: 2.1 mA
- Wide temperature range: $-40^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$
- Automotive qualified: AEC-Q100
- Optimized ESD performance: 8kV
- Designed for standalone PCB applications
- TSOT-3L Green Compliant package

## Application Examples

- Automotive, Consumer and Industrial
- BLDC motor commutation
- Solid-state Latch
- Low power applications
- Index counting
- Electrical power steering

## 1. Functional Diagram

## 2. General Description

The Melexis MLX92212 is a low voltage Hall-effect switch designed in mixed signal CMOS technology.
The device integrates a voltage regulator, Hall sensor with advanced offset cancellation system and an open-drain output driver, all in a single package.

The device features a low voltage regulator with optimized performances targeting low power consumption at low voltage levels.

It is suitable for use in automotive applications thanks to its wide temperature range and extensive qualification according to automotive standards.

The MLX92212 is delivered in a Green compliant 3-pin Thin Small Outline Transistor (TSOT-3L) for surface-mount process.

| South pole | B $>\mathrm{B}_{\text {OP }}$ | Low |
| North pole $^{(2)}$ | $\mathrm{B}<\mathrm{B}_{\mathrm{RP}}$ | High |

[^3]INSPIRED ENGINEERING

## 8. Detailed General Description

Based on mixed signal CMOS technology, Melexis MLX92212LSE-AAA-000 is a Hall-effect device with very high magnetic sensitivity. Melexis MLX92212LSE-ABA-000 is a Hall-effect device with a low hysteresis covering higher magnetic fields. Both versions are allowing the use of generic magnets, weak magnets or larger air gap.

The chopper-stabilized amplifier uses switched capacitor techniques to suppress the offset generally observed with Hall sensors and amplifiers. The CMOS technology makes this advanced technique possible and contributes to smaller chip size and lower current consumption than bipolar technology. The small chip size is also an important factor to minimize the effect of physical stress.
This combination results in more stable magnetic characteristics and enables faster and more precise design.
The operating voltage from 2.5 V to 5.5 V , low current consumption and large choice of operating temperature range according to "L" specification make this device suitable for automotive, industrial and consumer low voltage applications.

The output signal is open-drain type. Such output allows simple connectivity with TTL or CMOS logic by using a pull-up resistor tied between a pull-up voltage and the device output

## 9. Latch/Switch characteristics

The MLX92212-AAA exhibits magnetic latching characteristics.

Typically, the device behaves as a latch with symmetric operating and release switching points ( $\left.B_{O P}=\left|B_{R P}\right|\right)$. This means magnetic fields with equivalent strength and opposite direction drive the output high and low.

Removing the magnetic field $(B \rightarrow 0)$ keeps the output in its previous state. This latching property defines the device as a magnetic memory.

The MLX92212LSE-ABA, MLX92212LSE-ACA-000 and MLX92212LSE-ADA-000 exhibits magnetic switching characteristics.

The device is south pole active:
Applying a south magnetic pole greater than Bop facing the branded side of the package switches the output low.

Removing the magnetic field ( $B \rightarrow 0$ ) switches the output high. The use of the opposite magnetic pole facing the branded side does not affect the output state.

## 11. Application Information

### 11.1. Typical Three-Wire Application Circuit

## Notes:

1. For proper operation, a 10 nF to 100 nF bypass capacitor should be placed as close as possible to the $V_{D D}$ and ground pin.
2. A capacitor connected to the output is not obligatory, because the output slope is generated internally.

### 11.2. Automotive and Harsh, Noisy Environments Three-Wire Circuit

## Notes:

1. For proper operation, a 10 nF to 100 nF bypass capacitor should be placed as close as possible to the $\mathrm{V}_{\mathrm{DD}}$ and ground pin.
2. The device could tolerate negative voltage down to -0.5 V , so if negative transients over supply line $\mathrm{V}_{\text {PEAK }}<-32 \mathrm{~V}$ are expected, usage of the diode D1 is recommended. Otherwise only R1 is sufficient.
When selecting the resistor R1, three points are important:

- the resistor has to limit $\mathrm{I}_{\mathrm{DD}} / \mathrm{I}_{\mathrm{DDREV}}$ to 40 mA maximum
- the resistor has to withstand the power dissipated in both over voltage conditions ( $V_{R 1}{ }^{2} / R 1$ )
- the resulting device supply voltage $V_{D D}$ has to be higher than $V_{D D} \min \left(V_{D D}=V_{C C}-R 1 . I_{D D}\right)$

3. The device could tolerate positive supply voltage up to +6 V (until the maximum power dissipation is not exceeded), so if positive transients over supply line with $\mathrm{V}_{\text {PEAK }}>6 \mathrm{~V}$ are expected, usage a zener diode $\mathrm{Z1}$ is recommended. The R1-Z1 network should be sized to limit the voltage over the device below the maximum allowed.

## 12. Standard information

### 12.1. Storage and handling of plastic encapsulated ICs

Plastic encapsulated ICs shall be stored and handled according to their MSL categorization level (specified in the packing label) as per J-STD-033.

Electronic semiconductor products are sensitive to Electro Static Discharge (ESD). The component assembly shall be handled in EPA (Electrostatic Protected Area) as per ANSI S20.20

For more information refer to Melexis Guidelines for storage and handling of plastic encapsulated ICs ${ }^{(1)}$

### 12.2. Assembly of encapsulated ICs

For Surface Mounted Devices (SMD, as defined according to JEDEC norms), the only applicable soldering method is reflow.

For Through Hole Devices (THD), the applicable soldering methods are reflow, wave, selective wave and robot point-to-point. THD lead pre-forming (cutting and/or bending) is applicable under strict compliance with Melexis Guidelines for lead forming of SIP Hall Sensors ${ }^{(1)}$.

Melexis products soldering on PCB should be conducted according to the requirements of IPC/JEDEC and J-STD-001. Solder quality acceptance should follow the requirements of IPC-A-610.

For PCB-less assembly refer to the relevant application notes ${ }^{(1)}$ or contact Melexis.

Electrical resistance welding or laser welding can be applied to Melexis products in THD and specific PCB-less packages following the Guidelines for welding of PCB-less devices ${ }^{(1)}$.

Environmental protection of customer assembly with Melexis products for harsh media application, is applicable by means of coating, potting or overmolding considering restrictions listed in the relevant application notes ${ }^{(9)}$

For other specific process, contact Melexis via www.melexis.com/technical-inquiry

### 12.3. Environment and sustainability

Melexis is contributing to global environmental conservation by promoting non-hazardous solutions. For more information on our environmental policy and declarations (RoHS, REACH...) visit www.melexis.com/environmental-forms-and-declarations

[^4]

Happy to help you! www.melexis.com/contact

[^0]:    ${ }^{1}$ Including current through the protection structure. Max Power dissipation should be also considered.
    ${ }^{2}$ Human Body Model according AEC-Q100-002 standard

[^1]:    ${ }^{1}$ Guaranteed by design and verified by characterization, not production tested
    ${ }^{2}$ The Power-On time represents the time from reaching VDD $=2.5 \mathrm{~V}$ to the first refresh of the output.
    ${ }^{3}$ If VDD drops below VPOR the output is reset to High state.

[^2]:    ${ }^{1}$ Temperature coefficient is calculated using the following formula:
    $\frac{B_{O P T 2}-B_{O P T 1}}{B_{O P T 1} \times\left(T_{2}-T_{1}\right)} * 10^{6}, \mathrm{ppm} /{ }^{\circ} \mathrm{C} ; \mathrm{T}_{1}=25^{\circ} \mathrm{C} ; \mathrm{T}_{2}=150^{\circ} \mathrm{C}$
    Value guaranteed by design and verified by characterization, not production tested.

[^3]:    ${ }^{1}$ Magnetic pole facing the branded / top side of the package
    ${ }^{2}$ North pole or absence of field or South field lower then Brp (ABA/ACA/ADA version)
