US5881
Unipolar Hall Switch
Low Sensitivity

Features and Benefits
- Wide operating voltage range from 3.5V to 24V
- Low sensitivity
- CMOS technology
- Chopper-stabilized amplifier stage
- Low current consumption
- Open drain output
- Thin SOT23 3L and flat TO-92 3L both RoHS Compliant packages

Applications
- Automotive, Consumer and Industrial
- Solid-state switch
- Interrupter
- Current detector
- Proximity detection

1. Functional Diagram

2. General Description

The Melexis US5881 is a unipolar Hall-effect switch designed in mixed signal CMOS technology.

The device integrates a voltage regulator, Hall sensor with dynamic offset cancellation system, Schmitt trigger and an open-drain output driver, all in a single package.

Thanks to its wide operating voltage range and extended choice of temperature range, it is suitable for use in automotive and solid state switch applications.

The device is delivered in a Thin Small Outline Transistor (TSOT) for surface mount process and in a Plastic Single In Line (TO-92 flat) for through-hole mount.

Both 3-lead packages are RoHS compliant.

9. Detailed General Description

Based on mixed signal CMOS technology, Melexis US5881 is a Hall-effect device with low magnetic sensitivity. Its sensitivity enables high accuracy in position sensing by the use of small air gap.

The chopper-stabilized amplifier uses switched capacitor technique to suppress the offset generally observed with Hall sensors and amplifiers. The CMOS technology makes this advanced technique possible and contributes to smaller chip size and lower current consumption than bipolar technology. The small chip size is also an important factor to minimize the effect of physical stress.

This combination results in more stable magnetic characteristics and enables faster and more precise design.

The wide operating voltage from 3.5V to 24V, “L” and “E” operating temperature range and low current consumption make this device especially suitable for automotive solid state switch applications.

The output signal is open-drain type. Such output allows simple connectivity with TTL or CMOS logic by using a pull-up resistor tied between a pull-up voltage and the device output.

10. Unique Features

The US5881 exhibits unipolar magnetic switching characteristics. Therefore, it operates only with one magnetic pole.

<table>
<thead>
<tr>
<th>Output level</th>
<th>Flux density</th>
</tr>
</thead>
<tbody>
<tr>
<td>OUT = High</td>
<td>B_OP</td>
</tr>
<tr>
<td>OUT switches to Low</td>
<td>B_UP</td>
</tr>
</tbody>
</table>

Unipolar switch characteristic

The UA package is south pole active: Applying a south magnetic pole greater than B_OP facing the branded side of the package switches the output low.

The SE package is north pole active: Applying a north magnetic pole greater than B_OP facing the branded side of the package switches the output low.

Removing the magnetic field (B→0) switches the output high. The use of the opposite magnetic pole facing the branded side does not affect the output state.

A magnetic hysteresis B_HYST keeps B_OP and B_UP separated by a minimal value. This hysteresis prevents output oscillation near the switching point.

12. Application Information

12.1. Typical Three-Wire Application Circuit

12.2. Two-Wire Circuit

12.3. Automotive and Harsh, Noisy Environments Three-Wire Circuit

13. Application Comments

For proper operation, a 100nF bypass capacitor should be placed as close as possible to the device between the V\textsubscript{DD} and ground pin.

For reverse voltage protection, it is recommended to connect a resistor or a diode in series with the V\textsubscript{DD} pin. When using a resistor, three points are important:

- the resistor has to limit the reverse current to 50mA maximum (V\textsubscript{CC} / R\textsubscript{1} ≤ 50mA)
- the resulting device supply voltage V\textsubscript{DD} has to be higher than V\textsubscript{DD} min (V\textsubscript{DD} = V\textsubscript{CC} - R\textsubscript{1}I\textsubscript{DD})
- the resistor has to withstand the power dissipated in reverse voltage condition (P\textsubscript{D} = V\textsuperscript{2}\textsubscript{CC} / R\textsubscript{1})

When using a diode, a reverse current cannot flow and the voltage drop is almost constant (=0.7V).

Therefore, a 1000Ω/0.25W resistor for SV application and a diode for higher supply voltage are recommended. Both solutions provide the required reverse voltage protection.

When a weak power supply is used or when the device is intended to be used in noisy environment, it is recommended that figure 13.3 from the Application Information section is used.

The low-pass filter formed by R\textsubscript{1} and C\textsubscript{1} and the zener diode Z\textsubscript{1} bypass the disturbances or voltage spikes occurring on the device supply voltage V\textsubscript{DD}. The diode D\textsubscript{1} provides additional reverse voltage protection.
14. Standard information regarding manufacturability of Melexis products with different soldering processes

Our products are classified and qualified regarding soldering technology, solderability and moisture sensitivity level according to following test methods:

**Reflow Soldering SMD’s (Surface Mount Devices)**

- IPC/JEDEC J-STD-020
  - Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices (classification reflow profiles according to table 5-2)
- EIA/JEDEC JESD22-A113
  - Preconditioning of Nonhermetic Surface Mount Devices Prior to Reliability Testing (reflow profiles according to table 2)

**Wave Soldering SMD’s (Surface Mount Devices) and THD’s (Through Hole Devices)**

- EN60749-20
  - Resistance of plastic-encapsulated SMD’s to combined effect of moisture and soldering heat
- EIA/JEDEC JESD22-B106 and EN60749-15
  - Resistance to soldering temperature for through-hole mounted devices

**Iron Soldering THD’s (Through Hole Devices)**

- EN60749-15
  - Resistance to soldering temperature for through-hole mounted devices

**Solderability SMD’s (Surface Mount Devices) and THD’s (Through Hole Devices)**

- EIA/JEDEC JESD22-B102 and EN60749-21
  - Solderability

For all soldering technologies deviating from above mentioned standard conditions (regarding peak temperature, temperature gradient, temperature profile etc) additional classification and qualification tests have to be agreed upon with Melexis.

The application of Wave Soldering for SMD’s is allowed only after consulting Melexis regarding assurance of adhesive strength between device and board.

Melexis is contributing to global environmental conservation by promoting lead free solutions. For more information on qualifications of RoHS compliant products (RoHS = European directive on the Restriction Of the use of certain Hazardous Substances) please visit the quality page on our website: [http://www.melexis.com/quality.aspx](http://www.melexis.com/quality.aspx)

15. ESD Precautions

Electronic semiconductor products are sensitive to Electro Static Discharge (ESD). Always observe Electro Static Discharge control procedures whenever handling semiconductor products.
16. Package Information

16.1. SE Package (TSOT-3L)

Notes:
1. Dimension “D” and “E1” do not include mold flash or protrusions. Mold flash or protrusion shall not exceed 0.15mm on “D” and 0.25mm on “E” per side.
2. Dimension “b” does not include dambar protrusion.

Marking:
Top side: 8yw
B = part number (US5881)
